

GE-1208 Open Channel Ultrasonic Flow Meter

User Manual

A.YITE TECHNOLOGY GROUP

HTTP://WWW.AYITE.NET
tech@ayite.net

1. Function:

This flowmeter need used with Parshall flume, the sensor will not contact with the liquid, so it will be much more safety and stability

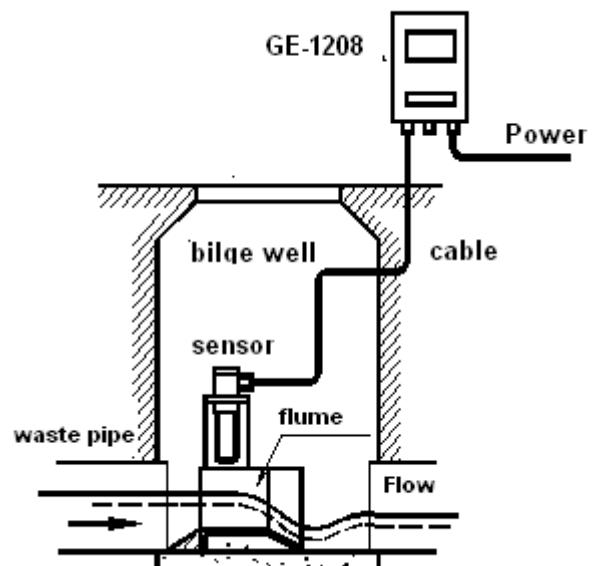

2. Principle

GE-1208 Meter measure the liquid level directly, the Parshall flume transfer the flow rate to the liquid level. This meter measure the liquid level, then calculate the flow rate, show the result on the screen.

2.1 the flume measure the flow

If we use the Parshall flume to measure the flow, there is relativity between the flow and the level, it mainly depend on the physical dimension.

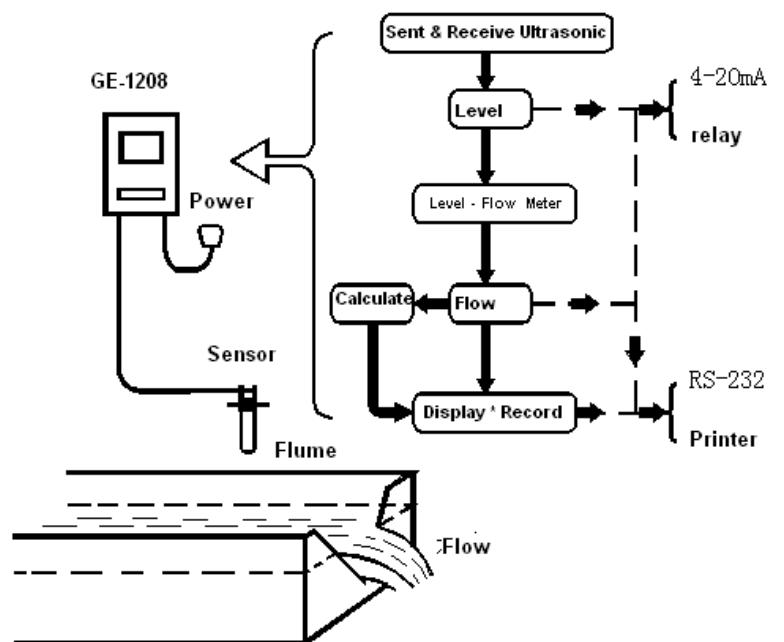

When we use the GE-1208 Flowmeter, we must know the relation between the flow rate and the liquid level. We could get this relation from the supplier of parshall flume, or check the standard data from the attached file.

2.2 The principle of meter

The flowmeter sent and receive the ultrasonic, transfer it to liquid level. there is the relative data in the meter, it could measure the flow by the level.

It have 4-20mA, reply, RS232 output.

3. Parameter Setup

Press “MENU” Button, then you will go to setup the parameter
 Press “MENU” Button, it will turn page on the screen
 Press “▶” Button, it will move the Changeable digit position
 Press “▲” Button, it will change the value of the changeable digit
 Press “RUN” button, it will finish setup, start to work

1. Display screen

0700 mm	Wale
000L/S	Flow
00000000m3/h	

Wale: the liquid level, measured by the sensor

Flow: It is the flow velocity

m3/h: it is cumulation for flow

Press “MENU” Button, setup the parameter

Parameter SET
20mA 0500.00
CleAcc 0 ADDE 001
Bad mold 0000mm

20mA 100L/s, means when 100L/s, the output is 20mA

ADDER 0000, it is RS485 address

Bad mold 0000, after install the sensor on the rack, connect with the meter, when there is no water in parshall flume, at this time, the GE-1208 meter show the value of liquid level; input this value as “Bad Mold” value by “▶” Button and “▲” Button, then the value of liquid level change to zero. then, when liquid flow into the flume, the GE-1208 will show the actual value of liquid level.

Alarm setup 1

Press “MENU” Button, setup the parameter

Parameter SET
I-Corre 0000%
A: ON 0000 mm
A: OFF 0000 mm

I-Corre 0000% The adjustmant of the 4-20mA current output

A ON 0000mm, Relay A, L<H switch ouput, L=0000mm

A OFF 0000mm, Relay A, L<H switch ouput, H=0000mm

Alarm setup 2

Press "MENU" Button, setup the parameter

Parameter SET
B: ON 0000 mm
B: OFF 0000 mm
Slot Mod 0000

B ON 0000mm, Relay B, L<H switch output, L=0000mm

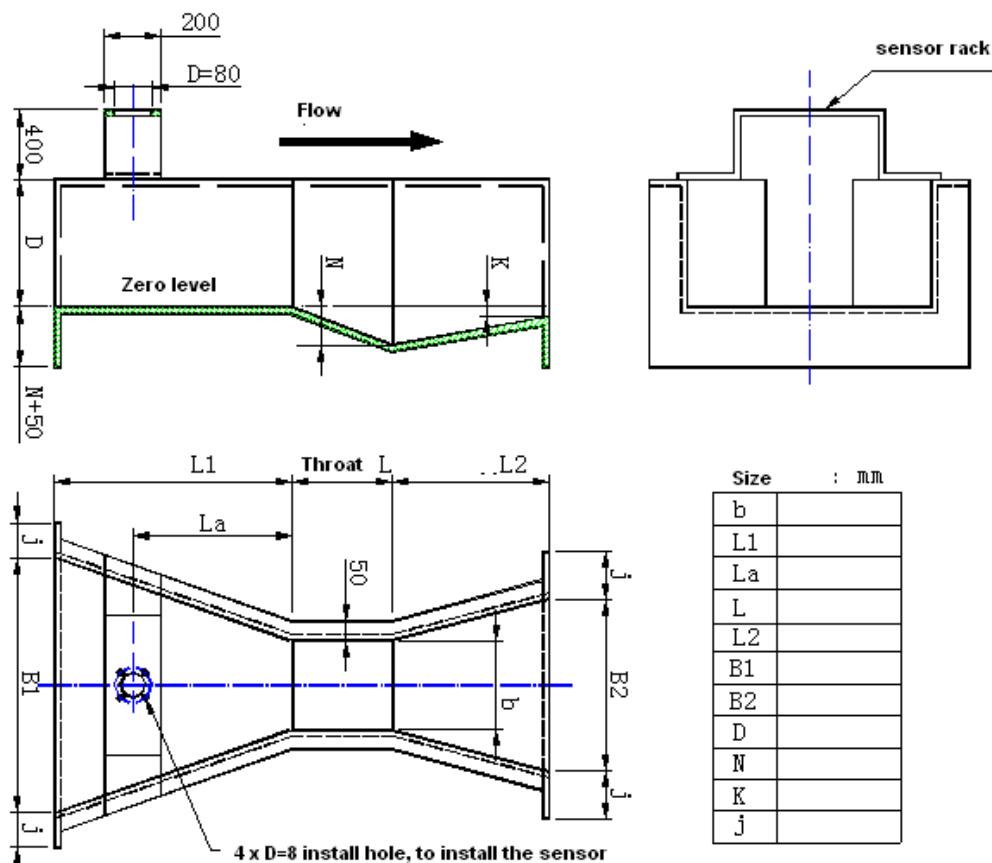

B OFF 0300mm, Relay B, L<H switch output, H=0300mm

Slot Mod, please check the attached data about parshall flume, if 0002, it relate to No.2 data sheet, b=0.051, flow is 50m³ /h.

After finish setup the parameter, press "▶" and "▲" at the same time, it will save the setup parameter.

4. Parshall flume

if the flow is more than 40L/s, we advise the parshall flume for you. Actually, in most condition, the flow is more than 40L/s.

The above drawing is for parshall flume, there is standard method to produce the parshall flume, so you just need check the value for b, L1, La, L, L2, B1, B2, D, N, K

Throat size "b" could be 0.051, 0.076, 0.152, 0.228, 0.3m, the parshall flume have standard technology data for the relation between the liquid level and the flow.

0.051m Throat size: Level: meter; Flow: L/s
